

# CVSPICE- CIRCUIT SOLVER

## CVI Club

### Circuit

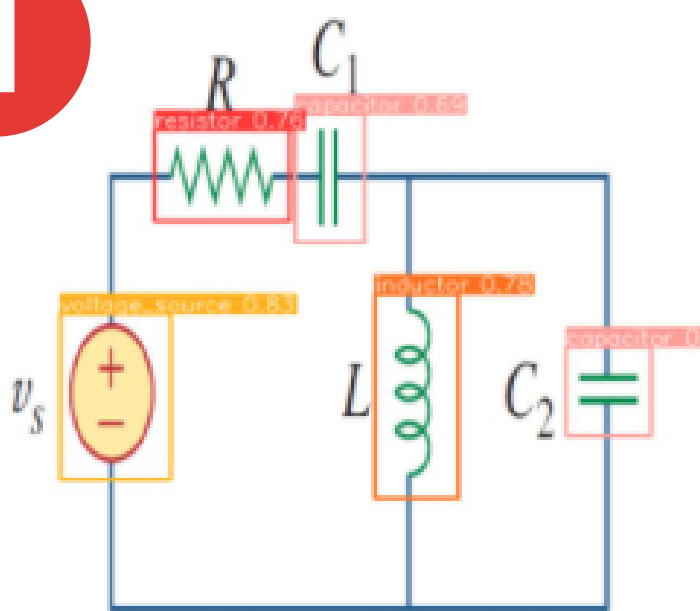

### Netlist

V1	0	2	20
L2	0	1	0.01
R3	3	2	10
C4	0	1	0.1
C5	1	3	1

Given an electric circuit image, outputs netlist describing components and their corresponding connectivity

### Identification of Circuit Components

1

We have trained around 350 annotated circuit images in YOLOv5 which identifies the circuit components with bounding boxes

### Identification of Component's terminal points

2

and

=

Terminal points of the circuit components are found by the intersection of the binary image of A-bounding boxes and B-adaptive thresholding of the original image.

(A and B) = terminal points

### Identification of Nodes

3

The nodes of the circuit are found using Breadth-First Search(BFS) algorithm

We are trying to increase the dataset which will also include hand-drawn circuits, and we are exploring OCR for detecting the values of the components directly without the user giving an input.
